

AI Assisted Coding (III Year) Assignment

Name:A.SaiTeja

Ht no:2303A52167

Batch:35

Lab 7: Error Debugging with AI – Systematic Approaches to Finding and Fixing Bugs

Week 4 – Monday

Lab Objectives

- **To identify and correct syntax, logic, and runtime errors in Python programs using AI tools.**
- **To understand common programming bugs and AI-assisted debugging suggestions.**
- **To evaluate how AI explains, detects, and fixes different types of coding errors.**
- **To build confidence in using AI to perform structured debugging practices.**

Task 1: Syntax Error – Missing Parentheses in Print Statement

Buggy Code

The screenshot shows a code editor window with the following code:

```
s def greet():
    print "Hello, AI Debugging Lab!"

greet()
...
File "/tmp/ipython-input-3503158804.py", line 2
    print "Hello, AI Debugging Lab!"
          ^
IndentationError: expected an indented block after function definition on
line 1
```

Below the code, there is a button labeled "Explain error".

Observed Error

- *SyntaxError occurs because Python 3 requires parentheses in print().*

AI Fix (Corrected Code):

The screenshot shows a code editor window with the following corrected code:

```
Gemini
def greet():
    print("Hello, AI Debugging Lab!")

greet()
...
Hello, AI Debugging Lab!
```

Explanation

- *In Python 3, print is a function, so parentheses are mandatory.*
- *Indentation was also corrected.*

Task 2: Logic Error – Incorrect Condition in If Statement

Buggy Code

```
▶ # Bug: Using assignment (=) instead of comparison (==)
def check_number(n):
    if n = 10:
        return "Ten"
    else:
        return "Not Ten"

...
File "/tmp/ipython-input-2678026509.py", line 3
    if n = 10:
          ^
SyntaxError: invalid syntax. Maybe you meant '==' or ':=' instead of '='?

Next steps: Explain error
```

Why This Causes a Bug

- *= is used for assignment, not comparison.*
- *Conditions require ==.*

AI Fix (Corrected Code) :

```
▶ def check_number(n):
    if n == 10:
        return "Ten"
    else:
        return "Not Ten"
```

[+ Code](#) [+ Text](#)

Task 3: Runtime Error – File Not Found

Buggy Code

```
▶ # Bug: Program crashes if file is missing
def read_file(filename):
    with open(filename, 'r') as f:
        return f.read()

print(read_file("nonexistent.txt"))

...
-
FileNotFoundException          Traceback (most recent call
last)
/tmp/ipython-input-3903500015.py in <cell line: 0>()
      4         return f.read()
      5
----> 6 print(read_file("nonexistent.txt"))

/tmp/ipython-input-3903500015.py in read_file(filename)
      1 # Bug: Program crashes if file is missing
      2 def read_file(filename):
----> 3     with open(filename, 'r') as f:
      4         return f.read()
      5

FileNotFoundException: [Errno 2] No such file or directory: 'nonexistent.txt'

Next steps: Explain error
```

Observed Error

- **FileNotFoundException occurs when file does not exist.**

AI Fix (Safe Code with Try-Except):

```
▶ def read_file(filename):
    try:
        with open(filename, 'r') as f:
            return f.read()
    except FileNotFoundError:
        return "Error: File not found."
    except Exception:
        return "Error: Invalid file path or access issue."
```

Task 4: Calling a Non-Existent Method

Buggy Code:

```
▶ # Bug: Calling an undefined method
  class Car:
      def start(self):
          return "Car started"

  my_car = Car()
  print(my_car.drive()) # drive() is not defined

...
-
AttributeError                                     Traceback (most recent call
last)
/tmp/ipython-input-566315127.py in <cell line: 0>()
      5
      6 my_car = Car()
----> 7 print(my_car.drive()) # drive() is not defined

AttributeError: 'Car' object has no attribute 'drive'
```

Next steps: [Explain error](#)

Problem

- ***drive() method does not exist, so AttributeError occurs.***

AI Fix :Correct the Method Call:

```
▶ class Car:
    def start(self):
        return "Car started"

    my_car = Car()
    print(my_car.start())

...
Car started
```

Task 5: *TypeError – Mixing Strings and Integers in Addition*

Buggy Code:

```
▶ # Bug: TypeError due to mixing string and integer
  def add_five(value):
      return value + 5

  print(add_five("10"))

...
-
TypeError                                     Traceback (most recent call
last)
/tmp/ipython-input-3441793644.py in <cell line: 0>()
      3     return value + 5
      4
----> 5 print(add_five("10"))
      6

/tmp/ipython-input-3441793644.py in add_five(value)
      1 # Bug: TypeError due to mixing string and integer
      2 def add_five(value):
----> 3     return value + 5
      4
      5 print(add_five("10"))

TypeError: can only concatenate str (not "int") to str
```

Next steps: [Explain error](#)

Observed Error

- *TypeError occurs because "10" is a string and cannot be added to integer 5.*

AI Correction: String Concatenation:

```
▶ def add_five(value):
    return int(value) + 5
```

Final Conclusion

This lab demonstrated how AI tools help in debugging different types of errors:

- ***Syntax Errors (missing parentheses, indentation)***
- ***Logic Errors (wrong operators in conditions)***
- ***Runtime Errors (missing files, invalid paths)***
- ***Attribute Errors (undefined method calls)***
- ***Type Errors (mixing incompatible data types)***

AI-assisted debugging improves productivity, but human understanding is necessary to validate fixes and write reliable code.
